

定义枚举类：

```
1 public enum SysErrorCode
2     implements ResponseStatus
3     (某种固定格式的响应类型,如(int errorCode,String message)){
4     $0000001(0000001,"错误1"),
5     $0000002(0000002,"错误2"),
6     $0000003(0000003,"错误3"),
7     $0000004(0000004,"用户名为空, 请重试")
8 ;
9 private int code;
10 private String message;
11 SysErrorCode(int code,String message){
12     this.code=code;
13     this.message=message;
14 }
15
16 //假设该枚举类实现的接口写了两个方法
17 @Override
18 public Integer getCode(){
19     return this.code;
20 }
21
22 @Override
23 public String getMessage(){
24     return this.message;
25 }
26
27 }
```

定义返回对象类：

```
1 public class SysResponseDIY extends response<T> (){
2     public static info(ResponseStatus responseStatus){
3         return responseStatus;
4     }
5 }
```

使用枚举对象：

```
1 public class SysResponseDIY test(String name){
2     if(StringUtils.isEmpty(name)){
3         //假设SysResponseDIY该类有静态返回方法
4         return SysResponseDIY.info(SysErrorCode.$0000004);
```

5 }

6 }
